Elizabeth Hernandez

409-747-2036 [eliherna@utmb.edu](mailto:eliherna@utmb.edu)

# STAY ON TOP OF YOUR HEALTH

Breast Cancer is one of the most common cancers in women.  
Early detection and effective treatment for breast cancer have been shown to improve survival.

## KNOW YOUR RISK

- ◆ **Talk to both sides of your family** to learn about your family health history
- ◆ **Talk to a doctor** about your risk of breast cancer

## KNOW WHAT IS NORMAL FOR YOU

- ◆ **See a doctor** if you notice any breast changes:
  - Lump, hard knot or thickening inside the breast or underarm area
  - Swelling, warmth, redness or darkening of the breast
  - Change in the size or shape of the breast
  - Dimpling or puckering of the skin
  - Itchy, scaly sore or rash on the nipple
  - Pulling in of the nipple or other parts of the breast
  - Nipple discharge that starts suddenly
  - New pain in one spot that doesn't go away

## GET SCREENED

- ◆ **Talk with your doctor** about which screening tests are right for you if you are at a higher risk. Screening tests are used to find breast cancer before it causes any warning signs or symptoms. Screening tests can find breast cancer early, when the chances of survival are highest.
  - **Clinical Breast Exam:** A physical exam done by a health care provider as part of your regular medical check-up. We recommend women get a clinical breast exam at least every 3 years starting at age 20, and every year starting at age 40.
  - **Mammography:** A screening tool that uses X-rays to create images of the breast. It is the most effective screening tool used to find breast cancer today. We recommend women get a mammogram every year starting at age 40 if you are at average risk.
  - **Breast MRI:** A tool that uses magnetic fields to create images of the breast. It is used in breast cancer screening for some women at higher risk. It is also sometimes used as a follow-up test after an abnormal finding or for staging breast cancer.

## IF YOU FIND A LUMP

- ◆ **If you feel a lump in your breast** do not panic. Most lumps are not breast cancer, but something less serious. Some lumps will go away on their own. In younger women, lumps are often related to menstrual periods and will go away by the end of the cycle. However, if you find a lump (or any change in your breast or underarm area), it's best to see your health care provider to be sure it is not breast cancer. If you do not have a health care provider, one of the best ways to find a good one is to get a referral from a trusted family member or friend. If that's not an option, call Coastal Health & Wellness, Galveston County Health District, St. Vincent's House, or UTMB.

## FOLLOW-UP AFTER AN ABNORMAL FINDING ON A SCREENING TEST

- ◆ **Follow-up** after an abnormal finding on a screening test may include diagnostic mammography, breast MRI, and/or breast ultrasound. If screening finds something abnormal, don't delay getting follow-up tests. If breast cancer is found,
